stack-levels — zsh

# Same card. Same price. Only one got views.

Why a copy of your old post gets ignored.

1 test

step-01.sh

THE TEST

# I tested it on my own store

> I sell postcards on eBay.
"Sell similar" copies
an old listing.
A fresh listing starts
from zero.
Same cards. Two ways to list.

step-02.sh

THE RESULT

# Fresh listings got the push

> The copies sat still.
The fresh ones got shown.
Same card. Same price.
So what does that mean
for your app?

step-03.sh

THE LESSON

# Your launch post is a copy

> Reposting it word for word
is "sell similar"
for your app.
Give the feed something new.
Every single time.

step-04.sh

DO THIS

# Same product, new angle

> One buyer question per post.
One new detail each time.
A fix, a number,
a user's words.
The product stays.
The angle moves.

# You keep reposting. It keeps sinking.

Follow for more tests from my own store and my own app.
